Pursuant to the Court's August 8, 2003 Order, Plaintiff InterTrust Technologies

Corporation ("InterTrust") hereby submits its Disclosures of Asserted Claims and Preliminary

Infringement Contentions under Patent Local Rules 3-1 and 3-2 ("PLR 3-1 & 3-2 Disclosures")

to Defendant Microsoft Corporation ("Microsoft"). These PLR 3-1 & 3-2 Disclosures supercede
all previous PLR 3-1 and PLR 3-2 disclosures served by InterTrust in this case.

PATENT LOCAL RULE 3-1: DISCLOSURE OF ASSERTED CLAIMS AND PRELIMINARY INFRINGEMENT CONTENTIONS

#### (a) Asserted claims

InterTrust currently contends that the Microsoft products identified herein infringe the claims of U.S. Patents Nos. 6,185,683 B1 ("the '683 patent"); 6,253,193 B1 ("the '193 patent"); 5,920,861 ("the '861 patent"); 6,157,721 ("the '721 patent"); 5,982,891 ("the '891 patent"); 5,892,900 ("the '900 patent"); 5,917,912 ("the '912 patent"); 5,915,019 ("the '019 patent"); 5,949,876 ("the '876 patent"); 6,112,181 ("the '181 patent"); and 6,389,402 B1 ("the '402 patent"), as identified in the attached claim charts. As discovery progresses, InterTrust may determine that additional Microsoft products infringe the asserted patents and/or that Microsoft infringes additional patent claims. InterTrust reserves the right to supplement and/or amend its disclosures and infringement contentions.

#### (b) Accused products

InterTrust contends that various Microsoft products infringe the patent claims identified in the claim charts attached hereto. Accused products are listed in Exhibit A hereto. Accused products are listed in Exhibit A hereto, which is intended to encompass past, present, and future product versions that include the accused features and/or functionality.

#### (c) Claim charts

InterTrust submits the attached claim charts based solely on information available to it to date. Discovery is ongoing, and additional information is likely to be produced during discovery. InterTrust therefore reserves the right to supplement and/or amend its infringement assertions as discovery proceeds.

InterTrust contends that Microsoft infringes at least the claims of the '683, '193, '861, '721, '891, '900, '912, '019, '876, '181, and '402 patents identified in the claim charts attached hereto as Exhibits B and C:<sup>1</sup>

#### (d) Literal infringement and the doctrine of equivalents

InterTrust contends that Microsoft infringes the claims of the '683, '193, '861, '721, '891, '900, '912, '019, '876, '181, and '402 patents as specified in Exhibits B and C both literally and under the doctrine of equivalents.

#### (e) Priority from earlier applications

InterTrust claims priority for the claims of the '891, '912, '683, '193, '019, '876, and '402 patents-in-suit dating to application No. 08/388,107, filed February 13, 1995. InterTrust claims priority for the claims of the '900 patent-in-suit dating to application No. 08/695,927, filed August 12, 1996. InterTrust does not claim priority for the claims of the '721, '861, and '181 patents-in-suit dating to any earlier application.

#### (f) Reliance on InterTrust's own products

InterTrust does not currently intend to rely on the assertion that its own Commerce and Rights System products practice at least some of the claimed inventions of the '683, '193, '861, '721, '891, '900, '912, '019, '876, '181, and '402 patents-in-suit to support its infringement assertions against Microsoft.

#### PATENT LOCAL RULE 3-2: DOCUMENT PRODUCTION ACCOMPANYING DISCLOSURE

#### (a) Documents re disclosure and/or offer of sale

InterTrust is not currently aware of such documents other than the documents that have previously been produced. See IT00017664-19168, IT00020866-21695, IT00021700-23578,

Numbering/lettering/bolding has been added to the text of each claim for convenience only, and is not intended to alter, expand, or interpret the meaning of those claims. In instances where infringement claims are illustrated by quotation or reference to Microsoft documents, those

Exhibit B contains claim charts based upon publicly available or non-confidential sources. Exhibit C contains additional claim charts referencing material designated as "Attorneys' Eyes Only" by Microsoft, and is served under separate caption. No other information contained in these disclosures is designated confidential by either party, and InterTrust does not object to dissemination of this document, other than Exhibit C, to persons not permitted to view confidential information in this case. For ease of reference, the claim charts attached hereto include all claims previously disclosed by InterTrust, as well as new claims.

Numbering/bolding has been added to the text of each claim for convenience only, and

(b) Documents re conception, reduction to practice, and/or design/development
InterTrust has produced nonprivileged documents concerning the conception, design,
development, and reduction to practice of the inventions disclosed in the patents-in-suit. See,
e.g., IT00000005-17261, IT00036207-38606, IT00041497-549. In addition, InterTrust has
produced voluminous archives of source code created in the course of its business, some of
which may constitute additional evidence of the conception, design, development, and reduction
to practice of its patented inventions. InterTrust is not currently aware of any other such
nonprivileged documents in its possession or control other than said source code and the source

#### (c) Prosecution history of patents-in-suit

code and documents that have been produced.

The prosecution histories of the patents-in-suit have previously been produced. See, e.g., 1T00062350-67643, IT00070342-72434, FH00107455 – 107731, FH00113539-118857,

1	header;	
2	(ii) said header including an execution space identifier identifying at least one aspect of	Both scenarios: SUBSYTEM is a field in the PE Optional Header that is an execution space
. 4 5	an execution space required for use and/or execution of the load module associated with said header;	
6 7 8	(iii) said execution space identifier provides the capability for distinguishing between execution spaces providing a higher level of security and	Both scenarios: SUBSYSTEM distinguishes between programs that can run in kernel mode and those that can run in user mode. This is a key security concept of process separation that was introduced with Windows NT.
9	execution spaces providing a lower level of security;	The Subsystem field in the PE header is used by the system to indicate whether the
10 11		executable will run within Ring 3 (user mode) or use Ring 0 (native or kernel mode).  Anything running in Ring 3 is limited to its
12		own processing space. Executables running in Ring 0 can reach out to other spaces and have security measure built around them.
13 14	(b) using said information to identify and locate said one or more elements;	Scenario 1: the MSI file identifies and locates the elements
15	locate said one of more elements,	Scenario 2:
16		.CAB manifest is used to identify Physical location
17		OSD and/or INF is used to identify Logical location
18	(c) accessing said located one or more	Scenario 1: Using the MSI file
19 20	èléments;	Scenario 2: Using INF and/or OSD in cabinet
21		file
22	(d) securely assembling said one or more	Both scenarios: Using the Window Installer
23	elements to form at least a portion of said first component assembly;	OS service with various properties and flags on the settings for higher protection.
24	·	Windows Installer has numerous flags that the developer can set to indicate how the assembly
25		will be installed, in what privilege level, with how much user interface, and how much ability
26		the user has to watch or change what is occurring. These controls have been
27 28		strengthened with each release of Windows Installer. Windows Installer 1.1 and later has the ability to limit the users capabilities during the installation. In a Windows 2000
		Williams III a Williams 2000

Exhibit B

1 environment and later, using the Group Policybased Change and Configuration Management, 2 the administrator has the most control 3 Fields that can be set by the developer or administrator to control what users can do 4 include the following: Transformssecure can be set to a value of 1 5 to inform the installer that transforms are to be cached locally on the user's computer in a 6 location the user does not have write access. (Transforms create custom installations from a basic generic installation, for example to make the Finance versions different from the 8 Marketing version or English versions different from Japanese versions.) 9 AllowLockdownBrowse and DisableBrowse can prevent users from browsing to the 10 sources. SourceList can be used to specify the only 11 allowable source to be used for the installation of a given component. 12 Environment can be used to specify whether the installation can be done while the user is 13 logged on or only when no user is logged on. Security Summary Property conveys whether 14 a package can be opened as read-only or with no restriction. 15 Privileged Property is used by developers of installer packages to make the installation 16 conditional upon system policy, the user being an administrator, or assignment by an 17 administrator. Restricted Public Properties can be set as 18 variables for an installation. "For managed installations, the package author may need to 19 limit which public properties are passed to the server side and can be changed by a user that is 20 not a system administrator. Some are commonly necessary to maintain a secure 21 environment when the installation requires the installer use elevated privileges. " 22 SecureCustomProperties can be created by the author of an installation package to add 23 controls beyond the default list. MsiSetInternalUI specifies the level of user 24 interface from none to full. A Sequence Table can be used to specify the 25 required order of execution for the installation process. There are three modes, one of which is 26 the Administrative Installation that is used by the network administrator to assign and install 27 applications. InstallServicesAction registers a service for 28 the system and it can only be used if the user is

an administrator or has elevated privile permission to install services or that the application is part of a managed installation in the sources and disables browsing to mediate sources. It can be used with DisableBrowsing installations version 1.1 that does have some of the other capabilities.  AlwaysInstallElevated can be set per per machine and is used to install managed.	ation. s media bwse to sn't

5	34.	Product Infringing: Microsoft Operating Systems that support device driver
6	A descriptive data structure embodied on a	signature technology
7	computer-readable medium or other logic device including the following elements:	
8	a representation of the format of data contained in a first rights management data	The driver package's INF is a data structure. The INF contains multiple types
9	structure	of sections, structured as hierarchy /"branches," that the Windows operating system or its Plug and Play and/or Set-up
10 11	·	installation services "branch" through based on the operating system information
12		and device for which a driver is to be installed. The installation services use the
13		"branching" structure (format) to determine what files should be installed. The INF, further provides disk location information
14		and file directory path information for the files identified as necessary as a result of
15		the "branching" process.
16		The driver package is a "rights management" data structure based on the
17		fact that it is governed and based on the fact that it processes governed information.
18		Rights Management as Governed Item
19 20		A driver manufacturer can include rules governing the driver's installation and/or use in the driver's INF file. For example:
21		Security entries specify an access control
22		list for the driver.  Driver developers can specify rules that determine behavior of the driver package
23		based on the user's operating system
24		version, including product type and suite and the device for which the driver is to be installed
25		Rules specifying logging
<b>26</b> 27		Local administrators can establish policy as to what action or notification should occur
28		in the event that a driver being installed is not signed.

Exhibit B

1

2

	·	•
1		The operating system installation services
2		have a ranking criteria it follows when multiple drivers are available for a newly detected device. The criterion is used to
3		determine the driver best suited for ensuring compatibility with the operating
4 5		system and ensuring functionality of the device.
,		Drivers have been certified to be
6		compatible with specified operating system versions for their respective device classes.
7 8		The catalog file protects the integrity of the driver.
•		Microsoft distributes the Driver Protection
9 10		List to prevent known bad deriver from being installed.
11	·	Processing Rights Managed Items
		Certain drivers (SAP) have been explicitly
12		certified to protect DRM content.
13		MSDN – DRM Overview
14		A DRM-compliant driver must prevent unauthorized copying while digital content
15		is being played. In addition, the driver must disable all digital outputs that can transmit
16		the content over a standard interface (such as S/PDIF) through which the decrypted
17		content can be captured.
18	said representation including:	
19	element information contained within said first rights management data	The elements of a driver package include: A driver that is typically a dynamic-link
20	structure; and	library with the .sys filename extension. An INF file containing information that the
21		system Setup components use to install support for the device.
22		A driver catalog file containing the digital signature.
23		One or more optional co-installers which are a Win32® DLL that assists in device
24	·	installation NT-based operating systems. Other files, such as a device installation
25		application, a device icon, and so forth.
26	·	XP DDK - INF Version Section
27		The LayoutFile entry specifies one or more
28		additional system-supplied INF files that contain layout information on the source
		media required for installing the software
1		4

•		
1		described in this INF. All system-supplied INF files specify this entry.
2		
3		The CatalogFile entry specifies a catalog (.cat) file to be included on the distribution media of a device/driver.
4	organization information regarding	Within an INF is a hierarchy with the top
5	the organization of said elements within said first rights management	being a list of manufacturers, and sub-lists of models and at the bottom a list of install
6	data structure; and	information by model.
7		For Windows XP and later versions of NT-
,		based operating systems, entries in the
. 8		Manufacturer section can be decorated to
9		specify operating system versions. The specified versions indicate OS versions with which the specified INF <i>Models</i>
10		sections will be used. If no versions are
		specified, Setup uses the specified <i>Models</i>
11		section for all versions of all operating systems.
12		
		INF's SourceDisksNames and SourceDisksFiles sections specify
13		organization information.
14		XP DDK Source Media for INFs
		The methods you should use to specify source media for device files depend on
15		whether your INFs ship separately from the operating system or are included with the
16		operating system.
17		INFs for drivers that are delivered
		separately from the operating system specify where the files are located using
18		SourceDisksNames and SourceDisksFiles
19	·.	sections.
		If the files to support the device are included with the operating system, the
20		INF must specify a LayoutFile entry in the
21		Version section of the file. Such an entry
		specifies where the files reside on the operating system media. An INF that
22		specifies a LayoutFile entry must not
23		include SourceDisksNames and
	·	SourceDisksFiles sections.  XP DDK - INF SourceDisksNames
24		Section SourceDisksIvames
25		A SourceDisksNames section identifies
		the distribution disks or CD-ROM discs that contain the source files to be
26		transferred to the target machine during
27		installation. Relevant values of an entry in
27		the INF include:
28		diskid Specifies a source disk.
.		disk-description - Describes the contents

1		and/or purpose of the disk identified by
2		diskid.
		specifies the name of a tag file or cabinet file
3		supplied on the distribution disk, either in
4		the installation root or in the subdirectory
_		specified by <i>path</i> , if any.  path This optional value specifies the
5		path to the directory on the distribution
6		disk containing source files. The path is
_		relative to the installation root and is expressed as \dirname I\dirname 2 and so
7		forth.
8		flags For Windows XP and later, setting
. 0		this to 0x10 forces Setup to use cab-or-tag- file as a cabinet file name, and to use tag-
. 9	·	file as a tag file name. Otherwise, flags is
10	· · · · · · · · · · · · · · · · · · ·	for internal use only.  tag-file For Windows XP and later, if
11		flags is set to 0x10, this optional value
		specifies the name of a tag file supplied on the distribution medium, either in the
12	·	installation root or in the subdirectory
13		specified by path. The value should specify
	·	the file name and extension without path information.
14		XP DDK INF SourceDisksFiles Section
15		A SourceDisksFiles section names the source files used during installation,
16		identifies the source disks (or CD-ROM
10	1	discs) that contain those files, and provides
17		the path to the subdirectories, if any, on the distribution disks containing individual
18		files. Relevant values in an entry in the
		INF would include:  filename Specifies the name of the file on
19		the source disk.
20		diskid Specifies the integer identifying the source disk that contains the file. This
21		value and the initial path to the
21		subdir(ectory), if any, containing the named file must be defined in a
22		SourceDisksNames section of the same
23		INF.
		subdir This optional value specifies the subdirectory (relative to the
24		SourceDisksNames path specification, if
25		any) on the source disk where the named file resides.
26	information relating to metadata, said	me resides.
26	metadata including:	
27	metadata rules used at least in part to govern at least one aspect of use and/or	The driver manufacture can specify rules in the INF that govern the installation and/or
28	display of content stored within a rights	use of the driver. For example, security
20	management data structure,	entries specify an access control list for the
1		<b>.</b>

driver. Driver developers can specify rules in an INF file that determines behavior of the driver package based on the user's operating system version, including product type and suite. Also, rules related to logging can be specified as mentioned in next claim element.

#### <u>For Example – Access Control List</u> Rules

XP DDK - Tightening File-Open
Security in a Device INF File
For Microsoft Windows 2000 and later,
Microsoft tightened file-open security in
the class installer INFs for certain device
classes, including CDROM, DiskDrive,
FDC, FloppyDisk, HDC, and

SCSIAdapter.

If you are unsure whether the class installer for your device has tightened security on file opens, you should tighten security by using the device's INF file to assign a value to the **DeviceCharacteristics** value name in the registry. Do this within an addregistry-section, which is specified using the INF AddReg directive.

XP-DDK -- INF AddReg Directive

An INF can also contain one or more optional add-registry-section.security sections, each specifying a security descriptor that will be applied to all registry values described within a named add-registry-section.

A Security entry specifies a security descriptor for the device. The security-descriptor-string is a string with tokens to indicate the DACL (D:) security component. A class-installer INF can specify a security descriptor for a device class. A device INF can specify a security descriptor for an individual device, overriding the security for the class. If the class and/or device INF specifies a security-descriptor-string, the PnP Manager propagates the descriptor to all the device objects for a device, including the FDO, filter DOs, and the PDO.

For Example - Operating System Versioning

Operating-System Versioning for Drivers

1		under Windows XP
2		Setup selects the [Models] section to use
3		based on the following rules:
· 4		If the INF contains [Models] sections for several major or minor operating system
5		version numbers, Setup uses the section with the highest version numbers that are
6		not higher than the operating system version on which the installation is taking
. 7		place.
8		If the INF [Models] sections that match the
. 9		operating system version also include product type decorations, product suite
10		decorations, or both, then Setup selects the section that most closely matches the
11	said metadata rules including at least	running operating system.  The AddService directive can set up event-
12	one rule specifying that information relating to at least one use or display of	logging services for drivers.  INF AddService Directive
13	said content be recorded and/or reported.	An AddService directive is used to control how (and when) the services of particular
13		Windows 2000 or later device's drivers are loaded, any dependencies on other
		underlying legacy drivers or services, and so forth. Optionally, this directive sets up
15		event-logging services by the devices/drivers as well.
16		Relevant sections of the directive's entry include:
17	·	event-log-install-section -Optionally references an INF-writer-defined section in
18		which event-logging services for this device (or devices) are set up.
19		EventLogType Optionally specifies one
20		of System, Security, or Application. If omitted, this defaults to System, which is
21		almost always the appropriate value for the installation of device drivers. For example,
22		an INF would specify Security only if the to-be-installed driver provides its own
23		security support.  EventName Optionally specifies a name
24		to use for the event log. If omitted, this defaults to the given ServiceName.
25		
26	35. A descriptive data structure as in claim	·
27	34, in which:	The driver peakage is segured through a
28	said first rights management data structure comprises a first secure container.	The driver package is secured through a catalog file that is signed by Microsoft's Windows Hardware Quality Lab and

	·	
2		contains the hash of each file of the driver's package. The INF identifies the catalog file used to sign the driver package.
3	36. A descriptive data structure as in claim	
4	35, in which:	The first secure container is the driver
5	said first secure container comprises:	package secured by a catalog file.
6	said content; and	The content is the driver and related files within the signed driver package.
7	rules at least in part governing at least one use of said content.	The rules are within the INF, which is part of the signed driver package.
8	37. A descriptive data structure as in claim 36, wherein the descriptive data structure is stored in said first secure container.	The INF is stored within the signed driver package.
10	44. A descriptive data structure as in claim	
11	34, further including: a representation of the format of data	The manufacture and models sections in
12	contained in a second rights management	the INF Version section are provided for
13	data structure,	the possibility of a single INF representing the format for multiple drivers.
14		Operating system version "decorating" relating the architecture, major and minor
15		operating systems versions, product and suit information all relate to the target
16		environment and is used to identify the files necessary for the target environment.
17		An INF file, such as in the case of operating system targeting, can be used for
18	·	more than one driver package since it can contain more than one catalog file.
19		Further an INF can address the drives
20	said second rights management data	necessary for a multi-functional device.  The files of the second data structure would
21	structure differing in at least one respect from said first rights management data	vary from the files on the first data
22	structure.	
23	45. A descriptive data structure as in claim 44, in which:	
24	said information regarding elements	INF specify where the driver files are
25	contained within said first rights management data structure includes	located using the SourceDiskNames and SourceDiskFiles sections.
26	information relating to the location of at least one such element.	
27	<b>46.</b> A descriptive data structure as in claim	
28	44, further including:	
20	a first target data block including information relating to a first target	Operating system version "decorating" relating the architecture, major and minor

Exhibit B

Exhibit B

CLAIMILANGUAGE	PERCHAMORINERINGEMENTS
58.	Product Infringing: Microsoft .NET Framework, Visual Studio .NET, and tools that include the Assembly Generator tool AL.exe.
A method of creating a first secure container, said method including the following steps;	The Assembly Generation tool generates a portable execution file with an assembly manifest from one or more files that are either Microsoft intermediate language (MSIL) modules or resource files. When using the tool's signing option, the assembly becomes a secure container.
(a) accessing a descriptive data structure, said descriptive data structure including or addressing	The descriptive data structure is the text file used as input by the Assembly Generation tool.
(1) organization information at least in part describing a required or desired organization of a content section of said first secure container, and	The DDS specifies the link and or embed directives to indicate which source files should be included in the assembly, how the included resource will be tagged, and if the resource will be private. Private resources are not visible to other assemblies.  These tags are used to organize the assembly into named sections.  Private attributes are used to organize the assembly into both public and private sections. (Public sections are the default.)
(2) metadata information at least in part specifying at least one step required or desired in creation of said first secure container;	The text file can contain "options" relating to how the assembly should be built and additional information that should be included.
	Main – Specifies the method to use as an entry point when converting a module to an executable file.  Algid – Specifies an algorithm to hash all files.
	Comp - Specifies string for the Company field.  Conf - Specifies string for Configuration field  Copy - Specifies string for Copyright field.  Culture - Specifies the culture string to
	associate with the assembly.  Delay - Variation of this option specifies whether the assembly will be

fully or partially signed and wh public key is placed in the asser Description – Specifies the file of the assembly.  Flags – Specifies flags for such as the assembly is side-by-side compatible, assembly cannot ex with other versions if either they executing in the same applicatic domain, process or computer.  Keyf – Specifies a file that container to a key pair.  Product – Specifies the container to a key pair.  Product – Specifies string for Trace field.  Droduct – Specifies the assembly me Title – Specifies the assembly me Title – Specifies tring for Trace field.  (b) using said descriptive data structure to organize said first secure container contents.  (b) using said descriptive data structure to organize said first secure container contents.  (b) using said descriptive data structure to organize said first secure container.  Embed[name, private] – copies content of the file into the assemblies, AKA private:  Embed[name, private] – copies content of the file into the assemblies, a noptional private attribute.  Link[name, private] – file becon of the assembly via a link and a optional name tag, an optional name tag, an optional name tag, and opti	
with the resource name Security Evidence.  Fileversion – Specifies the file of the assembly.  Flags – Specifies flags for such as the assembly is side-by-side compatible, assembly cannot ex with other versions if either the executing in the same applicate domain, process or computer.  Keyf – Specifies a file that contakey or key pair to sign an assem Keyn – Specifies the container to a key pair.  Product – Specifies string for Prifield.  Product – Specifies string for IV Version.  Template – Specifies the assembly which to inherit all assembly me field.  V – Specifies version information  The following directives are used to which files are to be compiled into assembly, how they will be tagged, whether or not they will be tagged, whether or not they will be visible assemblies, AKA private:  Embed[name, private] – copies content of the file into the assemantly via a link and applies an optional name tag, an optional private attribute.  Link[name, private] – file become of the assembly via a link and applies an optional private attribute.	nbly. ription
Security.Evidence. Fileversion – Specifies the file of the assembly. 3	記述は GLAIM LANGUAGE と さんしゅう	CLAIM OF INFRINGEMENT
4	1.	Products infringing: All products that include the Common Language Runtime or Compact Common Language Runtime or Common
		Language Infrastructure.
6	A method for using at least one resource processed in a secure operating environment at	Resource may constitute a Microsoft Windows process or hardware element; secure operating
7	a first appliance, said method comprising:	environment is Microsoft Common Language
8		Runtime ("CLR") environment, Common Language Infrastructure ("CLI") or Compact
9		CLR ("CCLR"); first appliance is computer running CLR, CLI or Compact CLR. Two
		infringing scenarios are set forth herein: (1) For CLR, an administrator, using the .NET
10		framework caspol exe tool remotely configures
11		security policy in a .NET configuration file for a machine, enterprise, user, or application and
12		that security policy interacts with rules or evidence declared in a shared assembly
13		provided by another entity ("1st scenario"); and
14	·	(2) for CLR, CLI and CCLR two assemblies are delivered to an appliance; the first
15		assembly has a rule that demands permissions from a caller in the second assembly, and the
		second assembly includes a control that asserts
16	·	such permissions or provides evidence that convinces the runtime that it has such
17		permissions. ("2 <sup>nd</sup> scenario"). In each scenario Microsoft .NET "Code Access Security"
18	·	framework or "Role Based Security"
19		framework is used.
20	(a) securely receiving a first entity's control at said first appliance, said first entity being	1 <sup>st</sup> scenario: first entity is the administrator, and the policy that constitutes this entity's
	located remotely from said operating	control is securely received at the first
21	environment and said first appliance;	appliance through a session established between the administrator's computer and the
22		first appliance, requiring security credentials such as the administrator's login and password
23		or other secure session means.
24		2 <sup>nd</sup> scenario: first entity is creator or distributor of the first assembly, assembly manifest
		includes a control demanding or refusing or otherwise asserting a security action on
25		permissions from a caller; first assembly is
26.	(b) securely receiving a second entity's control	integrity-checked.  Second entity's control is contained in shared
27	at said first appliance, said second entity being	assembly manifest (and therefore integrity
28	located remotely from said operating environment and said first appliance, said	protected) that provides evidence for obtaining permissions, or asserts permissions; assembly
۵۵	second entity being different from said first	creator/distributor is located remotely and is
	·	

1 2	entity; and	not the administrator (1 <sup>st</sup> scenario) or creator/distributor of the first container (2 <sup>nd</sup> scenario);
3	(c) securely processing a data item at said first appliance, using at least one resource,	Secure processing is carried out by CLR, CLI or CCLR, Data item constitutes an executable
4	including securely applying, at said first appliance through use of said at least one	code element, an interface controlled by such an executable, a data collection or stream (such
5	resource said first entity's control and said second entity's control to govern use of said	as media file or stream or text file) or an environment variable. CLR, CLI or CCLR
6	data item.	securely processes the rules, which will in both scenarios govern access to methods and data from the first assembly. The resource named in
7		the claim is, e.g., a Windows process that is established by the runtime or hardware element
8		on the computer.
9	51. A method as in claim 1 wherein at least said secure processing step is performed at an end user electronic appliance.	Consumer computer or appliance running Microsoft CLR, CLI or CCLR).
11	58. A method as in claim 1 wherein the step of securely receiving a first entity's control	1 <sup>st</sup> scenario 1: link is LAN or WAN; 2 <sup>nd</sup> scenario: link is any telecommunications link,
12	comprises securely receiving said first entity's control from a remote location over a	including the internet.
13	telecommunications link, and the step of securely receiving said second entity's control	
14	comprises securely receiving said second entity's control from the same or different	
15	remote location over the same or different telecommunications link.	
16	65. A method as in claim 1 wherein the processing step includes processing said first	Secure processing environment is CLR, CLI or CCLR running on user's computer or
17 18	and second controls within the same secure processing environment.	appliance.
19	71. A method as in claim 1 further including the step of securely combining said first	In scenario 2, arrangement consists of the stack frame, and the corresponding array of
20	entity's control and said second entity's control to provide a combined control arrangement.	permission grants for assemblies on the stack, and the permission demanded by the first
21		assembly. Secure combining performed by the CLR, CLI or CCLR.
22	76. A method as in claim 1 wherein said two securely receiving steps are independently	Steps are performed at different times in both scenarios.
23	performed at different times.  84. A method as in claim 1 wherein at least one	In both scenarios the second entity supplies an
24	of the first entity's control and the second entity's control comprises at least one	assembly with a demand procedure executed by the CLR, CLI or CCLR. The data
25	executable component and at least one data component.	component is a specific attribute value referenced by the assembly.
26 27	89. A method as in claim 1 wherein said first appliance includes a protected processing environment, and wherein:	Microsoft Common Language Runtime (CLR), Common Language Infrastructure (CLI), or Compact Common Language Runtime (CCLR)
28	(a) said method further comprises a step of receiving, at said first appliance, said data item	Typically occurs in both scenarios.

FOR U.S. PATEN	NT NO. 5,982,891
22.	Infringing products include Office 2003 and included applications, and Server 2003, including Microsoft hosted RMS Service using Passport
A method of securely controlling use by a third party of at least one protected operation with respect to a data item comprising:	A user (third party) accesses an IRM-protected data item governed by IRM controls under two or more RMS servers. For example, the data item may be a IRM-protected document.
	The IRM controls may be associated with the
	data item directly or via a IRM-protected container holding the IRM-protected data item such as an IRM-protected email with the IRM-protected document attached.
(a) supplying at least a first control from a first party to said third party;	The user acquires a first use license from a first RMS server (first party) enabling access to, the
	IRM-protected data item under the IRM rules associated with the first RMS server. For
	example: (1) the first use license from the firs RMS server permits the user to access a IRM-protected document contained within or
	attached to an IRM-protected email; or (2) the first use license from the first RMS server
	applies a first set of IRM rules to an IRM- protected document.
(b) supplying, to said third party, at least a second control from a second party different from said first party;	The user acquires a second use license from a second RMS server (second party) enabling access to the IRM-protected data item under
·	the IRM rules associated with the second RMS server. For example: (1) in addition to the user being given access to an IRM-protected
	email based on a first use license, a second RMS server provides a second use license enabling access to the IRM-protected
	document attached thereto; or (2) the second use license from the second RMS server applies a second set of IRM rules to the IRM-protected document.
(c) securely combining at said third party's location, said first and second controls to form a control arrangement;	The first and second use licenses are combine to form a control arrangement that governs access to the IRM-protected data item.
(d) securely requiring use of said control arrangement in order to perform at least one protected operation using said data item; and	The combined first and second use licenses govern access to the IRM-protected data item
(e) securely performing said at least one protected operation on behalf of said third party with respect to said data item by at least in part employing said control arrangement	The user performs a protected operation (e.g., read, print, edit) on the IRM-protected data item. The combined first and second use licenses are employed to permit the protected operation.
	T OPOINTOIL.

Exhibit B

1	23. A method as in claim 22 wherein said data	The data item is encrypted and protected by
2	item is protected.	IRM.
3	39. A method as in claim 22 further including securely and persistently associating at least one of: (a) said first control, (b) said second	The first and/or second use license are securely and persistently associated with the IRM-protected data item.
4	control, and (c) said control arrangement, with said data item.	protected data nem.
5	53. A method as in claim 22 wherein at least two of the recited steps are performed at an end	Steps performed at a user's computer or appliance.
6	user electronic appliance.	The first and second use licenses are received
7	60. A method as in claim 22 wherein step (a) comprises supplying said first control from at least one remote location over a	over a telecommunications link such as a networking or modem/serial interface.
8	telecommunications link, and step (b)	networking of modelluserial interface.
9	comprises supplying said second control from the same or different remote location over the	
·	same or different telecommunications link	Standard responses of the second seco
10	67. A method as in claim 22 wherein at least step (c) is performed within the same secure	Steps are performed at user's computer or appliance.
11	processing environment at said third party's location.	
12	91. A method as in claim 22 wherein:  (a) said method further comprises supplying	The first use license (first control) is received
13.	said data item to said third party separately and at a different time from supplying of said first	at the time that the user accesses the data item, which occurs separately and at a different time
14	control to said third party; and	from receipt of the IRM-protected data item itself.
15	(b) said securely performing step comprises	The protected operations require decryption of
12

4		.NET Framework SDK, and all products that include the Common Language
5		Runtime or Compact Common Language Runtime or Common Language
	• •	Infrastructure.
6	A secure method for combining data	Ann astrastias v.
7	items into a composite data item comprising:	
8	(a) securely providing, from a first location to a second location, a first data item	A first signed and licensed .NET component, .NET assembly, managed
9	having at least a first control associated therewith;	control and/or Web control (component) is the first data item. The first .NET
10	· ·	component developer (first location) provides the application assembly
11		developer (second location) the first component. The first control is the set of
12		declarative statements comprising the
13		LicenseProviderAttribute (alternately referred to as license controls).
14	(b) securely providing, from a third location to said second location, a second	A second signed and licensed component is the second data item. The second
	data item having at least a second control	component developer (third location) provides the application assembly
15	associated therewith;	developer (second location) the second
16	*	of declarative statements comprising the LicenseProviderAttribute.
17	(c) forming, at said second location, a	The application assembly developer will
18	composite of said first and second data items;	include at least the two components into its assembly.
19	(d) securely combining at said second location, said first and second controls to	At the second location, the application assembly developer uses the .NET runtime
20	form a control arrangement; and	that includes the LicenseManager.
21		Whenever a component is instantiated (here, an instance of the first licensed
22	·	component), the license manager accesses the proper validation mechanism for the
23		component. The license controls (first control) for the runtime license (derived
24	·-	from the design time license) are bound into the header of the .NET application
25		assembly, along with the second control for the second component.
26		Visual Studio.NET securely handles the
27		creation of runtime license controls.
28		Runtime licenses are embedded into (and bound to) the executing application
_ <b>-</b> -		assembly. The license control attribute

1 2 3		included in the first component is customized in the second location to express and require the runtime license. In a more advanced scenario, the License Complier tool can be used to create a "licenses file" containing licenses for
5		multiple components, including runtime licenses for components and classes created by the license provider. This .licenses file
6		is embedded into the assembly.
7		The third control set comprises the runtime license controls for the first and second
8		components (that had been bound to the assembly), the declarative controls provided by the application assembly
9 10		developer, and any runtime licenses for other components included by the
11	·	developer in application assembly. The controls are typically integrated into the header of the .NET application assembly
12	(e) performing at least one operation on	calling the first licensed component.  The proper execution of the application
13	said composite of said first and second data items based at least in part on said control	will require that the assembly have run time licenses for the two components.
14	arrangement.	
15 16	27. A method as in claim 26 wherein said combining step includes preserving each of said first and second controls in said composite set.	The set of declarative statements comprising the LicenseProviderAttribute of both the first and second components are included in the application assembly.
17	composite set.	meraded in the appreciation assembly.
18 19	28. A method as in claim 26 wherein said performing step comprises governing the operation on said composite of said first and second data items in accordance with said first control and said second control.	The application will require the first and second controls to operate properly when it calls the first and second data items, respectively.
20	Said first control and said second control.	
21	29. A method as in claim 26 wherein said providing step includes ensuring the integrity of said association between said	Signing the component that has embedded within it the license control ensures the integrity of the association of the control
22	first controls and said first data item is maintained during at least one of	and data item.
23	transmission, storage and processing of said first data item.	
24	31. A method as in claim 26 wherein said	The component includes the license control
25	providing step comprises codelivering said first data item and said first control.	and therefore they are codelivered.
26	40. A method as in claim 26 further	Each component includes the license
27	including the step of securely ensuring that	control. Signing the component that has embedded within it the license control
28	at least one of (a) said first control, (b) said second control, and (c) said control arrangement, is persistently associated with	ensures the persistence of the association of the control and data item.

4.	GLAIMIEANGUAGE	CHAIMOFINERINGEMENTS STANS
5		Product Infringing: Windows CE for Automotive
6	1. A security method comprising:	WCEfA is Microsoft Windows CE for Automotive, sometimes also known by its former name, AutoPC 2.0.
7		With WCEfA an OEM can assign their device to a class that only accepts certain kinds of software. The device
8		can be set to accept 1) any software with the correct processor/version 2) only certified software or 3) only
9		software from the OEM or Microsoft. These Security (or Trust) levels also control to which kernel APIs and middleware APIs the software has access.
10		Indules are M is the software has access.
11		Background: "Microsoft Software Install Manager (SIM), a component of WCEfA, allows you to control what can
12		be installed on your device platform. You can define your platform as being open, closed or restricted to new
14		installations, and SIM will enforce these designations." (D,pg.1)
5		"Anything can be installed on an open platform, as long as the applications are compiled for the appropriate
16 17		processor. At the other extreme, no third-party software can be installed on a closed platform. Only certified applications can be installed on a restricted platform."  (D, pg.1)
18		"By restricting installations to compliant applications,
19 20		the risk of installing and using incompatible or harmful software is greatly reduced, while still keeping the device open for robust, quality applications that enhance the user experience." (F, pg.1)
21		
22		WCEfA also has a Security Layer whose purpose is to "Create an abstraction layer of security surrounding ISV applications to limit and/or deny access to key Windows
23		CE kernel API calls and WCEfA middleware APIs." I, pg. 1)
24	(a) digitally signing a first load module with a	A first load module is a WCEfA software component in
25	first digital signature designating the first load module for use by a first device class;	a signed .PE file. The first device class is a device that only allows software designated as "restricted" (or
26	<b>.</b> .	higher) to be installed. "Restricted" software is software that has been certified. With restricted software, the device also implements a Security Layer functionality
27 <b>28</b>		that limits the kernel and WCEfA API calls that the software can make.

1

2

•		
1 -		"SIM Level: 1 = Restricted
2		Description: Only properly certified CEI (WCEfA device installation) files can be installed on the device.
3		Remote execution is restricted to executables with
3		master key.
4		Key: Logo certified CEI file required. CEI files or EXEs with master keys permitted." (F, pg.1)
5		
		"The kernel loader calls it each time a module is loaded by Windows CE. It returns one of the following values
6		that determine the module's access to kernel resources:
7		Value
8		Meaning
9		OEM_CERTIFY_TRUST (2)
9		The module is trusted by the OEM to perform any operation.
10		operation.
11		OEM_CERTIFY_RUN (1) The module is trusted by the OEM to run but is
12		restricted from making certain function calls.
		OEM_CERTIFY_FALSE (0)
13		The module is not allowed to run.
14		"(H, pg. 1)
15		Digitally signing: "Before the kernel loads a file, it uses
16		the OEMCertifyModule function to verify that the file
		contains the proper signature." (N, pg.1)
17		"Signfile.exe: This tool signs an executable with a
18		supplied private key. You can use the following command parameters with this tools AttribString,
19		specifies an optional attribute string to be included in the
- ,		signature. For example, you could add a string to indicate the trust level of the application." (O. Pg. 1)
20		In the MSDN article Verifying the Signature, the sample
21	· · ·	code segment states
22		"//the file has a valid signature // we expect the trust level to be returned as signed
		data
23		//case 'R': dwTrustLevel = OEM_CERTIFY_RUN" (N,
24		pg.2)
25		"The WCEfA Security Layer isolates installed
26	·	applications from making unrestricted kernel and
i		WCEfA API calls. This allows the OEM to assign one of three levels of security to applications and drivers
27		installed in RAM when they are loaded into the system.
28		The three levels are Trusted,Restricted, and BlockedOn the systems level, the WCEfA Security
		BlockedOn the systems level, the WCEIA Security

	_	
2		layer fits between ISV applications and isolates these software modules from having free access to all WinCE kernel calls and WCEfA middleware APIs." (I, pg. 1)
3 4 5		The developer submits their application for certification.  If it passes, then the .cei file (a form of cab file) receives a certification key from the certifier. The signed PE is within this .cei file.
6 7 8 9	(b) digitally signing a second load module with a second digital signature different from the first digital signature, the second digital signature designating the second load module for use by a second device class having at least one of tamper resistance and security level different from the at least one of tamper resistance and security level of the first device	A second load module is a WCEfA software component is a signed PE file. The second device class with a different tamper resistance or security level is a device that is "Closed", that is, it will not allow third party to software to be installed. A closed device only allows trusted software to run. The Security Layer setting of "Trusted" allows the Microsoft and OEM software full access to kernel and middleware APIs.
10 11 12 13	class;	In the MSDN article Verifying the Signature, the sample code segment states "//the file has a valid signature // we expect the trust level to be returned as signed data //case 'T': dwTrustLevel = OEM_CERTIFY_TRUST" (N, pg.2)
14 15 16 17		"Signfile.exe: This tool signs an executable with a supplied private key. You can use the following command parameters with this tools AttribString, specifies an optional attribute string to be included in the signature. For example, you could add a string to indicate the trust level of the application. (O. Pg. 1)
18 19 20		"SIM Level: 2 = Closed Description: Platform is limited to software supplied directly by OEM or Microsoft. Third-party applications cannot be installed Key: Master key required for any install or remote execution." (F, pg.1)
21· 22		Related to the Security Layer, the Trusted level "is most likely reserved for MS and OEM applications and drivers." (I, pg. 1)
23 24		Whereas the .cei files for certified software have a certification key (sometimes call MS Logo key), the .cei files from Microsoft or the OEM have a master key
25 26		attached. ""Master key required for any install or remote execution." (F, p.gl)  First load module is the certified software from a third
27	(c) distributing the first load module for use by at least one device in the first device class; and	party that will be run as part of the "Restricted" first device class.
28		"Once your application is complete, send the .cei file to

	,	
2 3		the organization that is performing validation or certification for the OEM. They would validate it, then either reject or return a .cei that has been stamped with a certification key. You would then reproduce this .cei file on CD-ROM or a compact flash card and distribute." (D,
4		p.g 5)
5		"APCLoad compares the device SIM level against the cei file certification key, and either allows the
6		installation to proceed or prohibits it based on the outcome of this comparison." (D, pg. 2)
7		"Security:. To achieve a high level of reliability,
8	· *-	WCEfA is carefully designed to: - Control the installation of certified and tested
· 9		software and drivers.  - Limit the access of system services by installed
10		module Monitor the proper execution of software"
11		(G, pg. 1)
12	(d) distributing the second load module for use by at least one device in the second device	The second load module is the certified software from the OEM or Microsoft that will be run as part of the
13.	class.	"Closed" second device class.
. 14		"You may need to change ROM components after your device ships, either to fix a problem, or to provide
15		enhanced functionality. For this purpose, the OEM is given a CEIBuild that adds a master key to a .cei file.
16		CEI files stamped with this master key can be installed on an open, closed or a restricted platform." (D, pg. 3)
17		"Trusted: The application is registered as a completely
18		trusted module and allowed full access to the kernel APIs and WCEfA APIs. This mode is mostly likely
19		reserved for MS and OEM applications and drivers.  Note that applications and drivers included in ROM are
20		automatically given trusted status." (l, pg.1)

5.	Product infringing: Windows Hardware Quality Lab certification services, and operating system products that support driver signature technology.
A software verifying method comprising:	Microsoft encourages manufacturers to have their device drivers tested and signed. For example, only signed drivers will ship "in-the-box." Also, Microsoft's driver
	ranking prefers signed drivers to unsigned drivers.
	Microsoft Web Page - Can't Find a Test Category for Your Driver?
·	WHQL's long-term objective is to be able to digitally sign all drivers. Although we do not currently have test programs for certain
	driver types, such as specialized device drivers and software filter drivers, WHQL
	is investigating a long term solution to expand the categories of drivers tested under Windows 2000 and ultimately all
	Windows operating systems. We are already formulating a test program for anti-
	virus file system filters, and plan to address other file system filter drivers as soon as the initial program is in place.
(a) testing a load module	The driver will be tested for each version of the operating system it supports and against the device class specification that apply to the device's class.
•	The driver package is a load module. A driver package contains one or more of the
	following files: A device setup information file (INF file) A driver catalog (.cat) file
	One or more optional co-installers
	Microsoft operates the Window Hardware Quality Lab, which tests drivers submitted by driver manufactures.
	The manufacturer can test their own driver
	using the Microsoft testing kit and submit the test results to WHQL when requesting signature. Additionally, Microsoft or a
	testing facility working with Microsoft can

,	<b>ii</b>	1
4	DESCRIPTION OF THE PROPERTY OF	**************************************
_	34.	Product Infringing: Products containing
5		Microsoft Common Language Runtime or Compact Common Language Runtime and
6	•	products implementing the Common Language
7	A protected processing environment	Infrastructure specification.  Microsoft Common Language Runtime and
7	comprising:	.NET Framework SDK;
8	a first tamper resistant barrier having a first	TAMPER RESISTANT BARRIER
9	security level,	The first tamper resistant barrier is the application domain in the CLR. The runtime
		hashes the contents of each file loaded into the
10		application domain and compares it with the hash value in the manifest. If two hashes don't
11	·	match, the assembly fails to load. [1]
12		Also "Code running in one application cannot
		directly access code or resources from another
13		application. The common language runtime enforces this isolation by preventing direct
14		calls between objects in different application
15		domains. Objects that pass between domains are either copied or accessed by proxy."[2]
	·	
16		SECURITY LEVELS
17		Application domains have different security
18		levels by setting security policy of the application domain programmatically. [3]
		"It has different security based on code-based
19		security model of .NET. Administrators and hosts use code-access security to decide what
20		code can do, based on characteristics of the
21	·	code itself, regardless of what user is executing the code. The code characteristics are called
21	·	evidence and can include the Web site or zone
22		from which the code was downloaded, or the
23	·	digital signature of the vendor who published the code."
		·
24		"When the security manager needs to determine the set of permissions that an
25		assembly is granted by security policy, it starts
26		with the enterprise policy level. Supplying the assembly evidence to this policy level will
		result in the set of permissions granted from
27		that policy level. The security manager typically continues to collect the permission
28		sets of the policy levels below the enterprise
1		policy [including the app domain] in the same
4		The state of the s

1

_		
1 2 3 4 5	-	fashion. These permission sets are then intersected to generate the policy system permission set for the assembly. All levels must allow a specific permission before it can make it into the granted permission set for the assembly."  Example of granted permission sets from a policy—
6		Condition: All code, Permission Set: Nothing
7		Condition: Zone: Internet, Permission Set: Internet Condition: URL:
/		www.monash.edu.au, Permission Set: MonashPSet
8		Condition: Strong Name: m-Commerce, Permission Set: m-
. 9	·	CommercePSet [4]
10		
11		Another difference in security levels can be whether the verification process is turned off or on, "Managed code must be passed through a
12		verification process before it can be run
13		(unless the administrator has granted permission to skip the verification). The verification process determines whether the
14	·	code can attempt to access invalid memory
	·	addresses or perform some other action that could cause the process in which it is running
15		to fail to operate properly. Code that passes the verification test is said to be type-safe. The
16	·	ability to verify code as type-safe enables the
17		common language runtime to provide as great a level of isolation as the process boundary, at
18		a much lower performance cost." [5]
19		
20	a first secure execution space, and	The application domain is the execution space for a particular application.
21	at least one arrangement within the first tamper resistant barrier that prevents the first secure execution space from executing the same	The second secure execution space is another application domain that has a different security policy than the first.
22	executable accessed by a second secure	-
23	execution space having a second tamper resistant barrier with a second security level different from the first security level.	If second app domain's security policy doesn't give any permission to code from internet zone, but first app domain does, then the code
24	different from the first seeding level.	would run in first app domain and not in
		second.[6] References:

25	said intended recipient's site.	the attached document, and the second rule is the rule(s) received that govern the email itself.
26		

Exhibit B 

4	126.	Product Infringing: Windows Hardware
5		Quality Labs Authentication services,
		Windows operating Systems (such as Windows XP) that support the driver
6		signing features, and any product using
7		Driver Signing feature
	A method of providing trusted intermediary services including the following steps:	
8	at a first apparatus, receiving an item from	Microsoft's Window Hardware Quality
9	a second apparatus;	Labs (WHQL) (first apparatus) receiving driver package (item) from independent
· 10		hardware vendor (IHV) or any driver developer (second apparatus).
11	associating authentication information with said item;	The signature information of a security catalog file (see next element of claim)
12		names Microsoft as the publisher. WHQL's signature is intended to signify
13	·	that a driver has complied with Microsoft's Windows compatibility and/or Secure
14	incorporating said item into a secure digital	Audio Path (SAP) specifications.  The hashes of the files making up the
15	container;	driver package are included in the signed security catalog file for the driver package.
16	·	The catalog file makes the driver package a
17	associating a first rule with said secure	Driver developers specify rules in an INF file that govern the installation and/or use
18	digital container, said first rule at least in part governing at least one aspect of access to or use of said item;	of the driver. For example, as specified in the INF, the installation events will vary
19	to of use of said item,	based on the user's operating system version, which includes architecture,
20	·	product type and suite. The INF logging rules and can further specify security rules
21		that are evaluated when the driver is used.
22		White Paper – Operating-System Versioning for Drivers under Windows XP
23	·	Setup selects the [Models] section to use
24		based on the following rules:
25	·	If the INF contains [Models] sections for several major or minor operating system
26	·	version numbers, Setup uses the section with the highest version numbers that are
27		not higher than the operating system version on which the installation is taking
28		place.

1

2

2 3 4		If the INF [Models] sections that match the operating system version also include product type decorations, product suite decorations, or both, then Setup selects the section that most closely matches the running operating system.
5 6 7		Suppose, for example, Setup is running on Windows XP Professional (which is operating system version 5.1), and it finds the following entry in a [Manufacturer] section:
8		%FooCorp%=FooMfg, NT, NT.5, NT.5.5, NT0x80
9 10 11 12		In this case, Setup will look for a [Models] section named [FooMfg.NT.5]. Setup will also use the [FooMfg.NT.5] section if it is running on a Datacenter version of Windows .NET Server, because a specific major/minor version takes precedence over the product type and suite mask.
13 14		For example, to create an INF that is intended for use only on Windows XP, the INF file could contain the following:
15 16 17	·	[Manufacturer] "Foo Corp." = FooMfg, NT.5.1, NT.5.2 [FooMfg.NT.5.1] "Foo Device" = FooDev, *FOO1234
- 18		Note the omission of the undecorated [FooMfg] section, as well as the omission of the [FooMfg.NT.5.2] section. This INF
19 20		file would appear to be "empty" on any operating system other than Windows XP.
21		Access Control List Rules
22		XP DDK - Tightening File-Open Security in a Device INF File
23		For Microsoft Windows 2000 and later, Microsoft tightened file-open security in
24	- · · · · ·	the class installer INFs for certain device classes, including CDROM, DiskDrive,
25		FDC, FloppyDisk, HDC, and SCSIAdapter.
26		If you are unsure whether the class installer for your device has tightened security on
27		file opens, you should tighten security by using the device's INF file to assign a value
28	·	to the DeviceCharacteristics value name in the registry. Do this within an add-
		<b>₩</b>

1	•	·
1		registry-section, which is specified using
2	transmitting said secure digital container	the INF AddReg directive.  Microsoft, IHV, driver developer or any
3	and said first rule to a third apparatus, said	other party distributing signed driver packages transmitting the driver package to
4	third apparatus including a protected processing environment at least in part protecting information stored in said	user (third apparatus). Since the driver package in package includes the INF file, it will
5	protected processing environment from tampering by a user of said third apparatus;	include the first rule. The protected processing environment (PPE) is Windows
6		operating system with its pertinent services such as Windows File Protection, signature
7	ı	and cryptographic functions, Plug and Play and Set-up and their related default and
8		modifiable policies. The PPE checks for signatures on driver packages and detects
. 9 .		situations when the driver package's signature does not match the driver
10		package.
11		Additionally, the Digital Rights Manager (DRM) components (kernel and client) will
12		contribute to making the third apparatus a PPE when the SAP functionality is
13		invoked. [That is, when SAP is required, an additional signature is checked to verify
14		that the driver is SAP compliant and that it hasn't been tampered with.]
15	said third apparatus receiving said secure digital container and said first rule;	The end-user receiving the driver package.
16	said third apparatus checking said authentication information; and	A step in the Plug and Play/Setup driver installation process checks signature at
17	,	installation. Additionally, the DRM component will check the DRM signature
18		when invoking DRM functionality.
19		White Paper - Driver Signing for Windows
20		During driver installation, Windows compares the hashes contained in the
21		driver's CAT file with the computed hash of the driver binaries to determine whether
22		the binaries have changed since the CAT file was created. If a driver fails the
23		signature check or there is no CAT file, what happens next depends on the driver
24		signing policy in effect on the user's system:
25		If the policy is set to Ignore, the driver
26		installs silently, with no message to the user.
27		If the policy is set to Warn, a message
28		warns the user the driver is unsigned, which means that it has not passed WHQL
1	·	

1		
1		testing and might cause problems. The Warn dialog box gives an administrative
2		user the option to override the warning and
3		install an unsigned driver anyway.
. 4		If the policy is set to Block, the system
·	10 m	displays a message that informs the user that the driver cannot be installed because
5		it is not digitally signed.
6	said third apparatus performing at least one action on said item, said at least one action	The action would be installing and/or using the driver. For example, installation
7	being governed, at least in part, by said	policies govern the actions (ignore, warn or
	first rule and by a second rule resident at said third apparatus prior to said receipt of	block) taken based on whether a driver is signed or not and these policies (rule) are
8	said secure digital container and said first	resident on the third apparatus. Another
9	rule, said action governance occurring at least in part in said protected processing	rule is the "ranking" of available drivers when selecting a driver to install. This
10	environment.	ranking process includes whether a driver
	·	is signed or not. Another rule is the security access rules that the class installer
11		that will be used to install the device has.
12		In the case of DRM, the content will have
13	·	associated rules governing its use in a SAP-
	·	complaint environment. These rules (the content license) can be resident at the third
14		apparatus particularly in the case when a
15		user is installing a new (SAP-compliant) device that will render previously acquired
16		content or in the case that acquired content
17		cannot be rendered until the user installs required drivers.
		For example, when installing:
18		
19		The XP driver ranking process and the modifiable default related to signature state
20		of the driver act as the second rule.
		The driver will be installed only if the first
21		and second rules validate.
22		Operating-System Versioning for Drivers
23		under Windows XP
24		Default System Policy for Unsigned
	·	Drivers
25		If the user installs an unsigned driver for a
26		designated device class from disk or from another web site, Windows XP/Windows
27		2000 displays a warning that the driver is
		unsigned, thus helping to preserve the integrity of the released system. However,
28		by default, Windows XP/Windows 2000

1		
2		does not block installation of unsigned drivers, so vendors can get urgent hot-fixes to customers while waiting for WHQL to test the fix.
4 5 6		In Windows XP, the default driver signing policy can be changed through the Hardware tab of the System applet on the Control Panel. A user can change the policy to be more restrictive, but not less restrictive on a per-user basis (that is, a
7 8 9		user can change Warn to Block, but not to Ignore). An administrator can change the policy to be either more restrictive or less restrictive for all users on the system by checking "Apply the setting as system
10		default."
11		Driver Ranking
12		Under Windows XP, the driver ranking strategy has been modified as follows:
13		If an INF file is unsigned, and if neither the
14 15		[Models] section nor the [DDInstall] section is decorated with an NT-specific extension, the INF file is considered "suspect" and its rank is shifted into a
16 17		higher range (that is, worse) than all hardware and compatible rank matches of INF files for which one (or both) of those criteria are met.
18		The new ranking ranges will now be:
19		0 – 0xFFF
20	·	(DRIVER_HARDWAREID_RANK): "trusted" hardware-ID match
21		0x1000 – 0x3FFF: "trusted" compatible- ID match
22		0x8000 – 0x8FFF: "untrusted" hardware- ID match
23		0x9000 – 0xBFFF: "untrusted" compatible-ID match
24		0xC000 - 0xCFFF: "untrusted" undecorated hardware-ID match (possibly a
25	÷	Windows 9x-only driver) 0xD000 - 0xFFFF : "untrusted"
26		undecorated compatible-ID match (possibly a Windows 9x-only driver)
27		
28	127. A method as in claim 126, in which said authentication information at least in	The authentication information will identify Microsoft, operator of the first
20	part identifies said first apparatus and/or a	identify Microsoft, operator of the first apparatus.
1		· · · · · · · · · · · · · · · · · · ·

user of said first apparatus.

3	126.	Products Infringing: Microsoft Software
4.		that includes the Authenticode feature,
		NET Framework SDK, Visual Studio, Microsoft technology that supports a digital
5		signature function (such as ActiveX),
6		Windows Installer technology.
	A method of providing trusted intermediary	Infringement is based on use Microsoft
7	services including the following steps:	ActiveX control, Cabinet file, Microsoft Windows Installer, Authenticode and
,		Software Restriction Policy technologies.
8		For example, a software publisher
9		distributing a signed application that has
		licensed ActiveX controls embedded
10	at a first apparatus, receiving an item from	within it would practice this method.  The item is unsigned software such as an
11	a second apparatus;	ActiveX control or any software packaged
**	**	in a cabinet file or Microsoft Installer
12		(.msi) file. Within the development environment, multiple software developers
,,		(working on a second apparatus) will send
13		their unsigned software to a secure location
14		(first apparatus) containing the entity's
		private signing key. An example entity would be a software publisher.
15		would be a software paonisier.
16		Source: Deploying ActiveX Controls on
	·	the Web with the Internet Component  Download
17		Download
18	·	The holder of the digital certificate
		Keeping your digital certificate safe is very
19		important. Some firms (including
20	·	Microsoft) do not keep their signature file
		on site. The signature is kept with the
21		Certificate Authority and files are sent there for signing.
22		
	associating authentication information with	Signing the software associates the
23	said item;	software publisher's identify with the software.
24	·	SOILWAIG.
27		Source: Packaging ActiveX Controls
25	·	Signing Cabinet Files  A .cab file can be digitally signed like an
2		A cab file can be digitally signed like an ActiveX control. A digital signature
26		provides accountability for software
27		developers: The signature associates a
		software vendor's name with a given file. A signature is applied to a .cab file (or
28	· .	control) using the Microsoft Authenticode®
Ì		

Exhibit B

1

1		technology.
2		The .cab tool set assists software developers in applying digital signatures to .cab files by allowing a developer to
. 3		allocate space in the .cab file for the
.4		signature.
5	incorporating said item into a secure digital container;	Signing software either directly or within a package (cabinet or .msi file) secures it in a digital container.
6		Alternately, the signed ActiveX control could be placed into a signed cabinet file.
7	associating a first rule with said secure digital container, said first rule at least in	The first rule would be the licensing support code within the ActiveX control
8	part governing at least one aspect of access to or use of said item;	and/or conditional syntax statements when the software is within a signed .msi file.
9		When the software is within a signed cabinet file, the first rule can be a rule
10		contained in the software, as is the case
11		when an ActiveX control is packaged in a signed cabinet file.
12	·	First rule, in the case of ActiveX:
13		When an application with a licensed ActiveX control is started, an instance of
14		the control usually needs to be created.
15		The application accomplishes this by making a call to CreateInstanceLic and
16	·	passing the license key embedded in the application as a parameter in the call. The
17		ActiveX control performs a string comparison between the embedded license key and its own copy of the license key. If
18		the keys match, an instance of the control is created and the application can execute
19		normally.
20		Source: Using ActiveX Controls to Automate Your Web Pages
21		Run-time licensing Most ActiveX Controls should support
22		design-time licensing and run-time licensing. (The exception is the control that
23		is distributed free of charge.) Design-time licensing ensures that a developer is
24		building his or her application or Web page with a legally purchased control; run-time
25		licensing ensures that a user is running an application or displaying a Web page that
26		contains a legally purchased control.  Design-time licensing is verified by control
27		containers such as Visual Basic, Microsoft
		Access, or Microsoft Visual InterDev®. Before these containers allow a developer
28	·	to place a control on a form or Web page,

1		they first verify that the control is licensed
2		by the developer or content creator. These containers verify that a control is licensed
3		by calling certain functions in the control:  If the license is verified, the developer can
4		add it.
4.		Run-time licensing is also an issue for
5		these containers (which are sometimes bundled as part of the final application); the
6		containers again call functions in the control to validate the license that was
7	ini a sid assume di sital containon	embedded at design time.  The third apparatus is a user computer or
8	transmitting said secure digital container and said first rule to a third apparatus, said	an application server. The protected
_	third apparatus including a protected processing environment at least in part	processing environment (PPE) is Windows operating system, Internet Explorer (IE)
9	protecting information stored in said	and pertinent operating IE services such as
10	protected processing environment from tampering by a user of said third apparatus;	Windows File Protection and security, signature and cryptographic functions
11		related to code signing and related policies. The PPE checks for signatures on software
12		or the software packages and detects
13		situations when the signature does not validate as an indication that tampering
	said third apparatus receiving said secure	may have occurred with the item.  Having the third apparatus receiving said
14	digital container and said first rule;	secure digital container and said first rule is
15		typical of networked computing environments.
16	said third apparatus checking said authentication information; and	Examine the signature information includes verifying that signature was creating using
17	authentication information, and	the private key that corresponds to the
18	said third apparatus performing at least one	public key of the publisher.  The action would be installation and/or use
	action on said item, said at least one action being governed, at least in part, by said	of the distributed software. The second rule can be software restriction policies
19	first rule and by a second rule resident at	resident on the machine, which can be
20	said third apparatus prior to said receipt of said secure digital container and said first	invoked at installation and/or runtime.
21	rule, said action governance occurring at	NET Framework Security – pg 259
22	least in part in said protected processing environment.	and
23	·	White Paper – Using Software Restriction
		Policies in Windows XP and Windows  NET Server to Protect Against
24		Unauthorized Software
25		Software Restriction Polices is a policy-
26		driven technology that allows administrators to set code-identity-based
27		rules that determine whether an application
28		is allowed to execute. (.NET Framework Security – pg 259)
-		1

1		For example, administrators can set rules for all Windows Installer packages coming from the Internet or Intranet zone.
3		As part of the DLL load mechanisms,
4		Software Restriction Policies is invoked and starts to check its most specific rules.
5		Software Restriction Policies get invoked prior to an .exe being able to run.
6		The four types of rules are – hash, certificate, path, and zone.
7		Note: The hash and certificate rules relate
8 9		directing to the signature information whereas, the path and zone rules do not.
	127. A method as in claim 126, in which	The software publisher, user of first device,
10	said authentication information at least in	is identified in the authentication information.
11	part identifies said first apparatus and/or a user of said first apparatus.	mormation.

5	126.	Product infringing: Visual Studio .NET, .NET Framework SDK, Authenticode, Products that contain the .NET CLR, Compact CLR or CLI.
6	A method of providing trusted intermediary	Compact CBN of CBN.
7	services including the following steps: at a first apparatus, receiving an item from	The item is an unsigned .NET assembly, which can include, but not be limited to, a
8	a second apparatus;	Web control, multi-file assembly or component. Within the development
9		environment, multiple assembly builders (working on a second apparatus) will send
10 11		their unsigned assembly to a secure location (first apparatus) containing the entity's private signing key. An example
12		entity would be a software publisher.
13		.NET Security Framework – pg 130-1
14		Describes this exact practice and further explains the "Delay Signing Assemblies"
15		feature of .NET that accommodates the fact that "many publishers will keep the private key in a secure location, possibly
16		embedded in specially designed cryptographic hardware."
17		"Delay signing is a technique used by
18 19		developers whereby the public key is added to the assembly name as before, granting
20		the assembly its unique identity, but no signature is computed. Thus, no private
21	associating authentication information with	key access is necessary."  Strong naming the assembly binds the entity's/publisher's name into the
22	said item;	assembly. The public portion of the key used to strongly name the assembly is
23		placed in the assembly manifest. Other
24	·	assemblies or applications can contain references to the strong names of strongly named assemblies such as in the case of
25		applications that contain references to a set
26		of compliant .NET core libraries. Strong naming compliant .NET core libraries with the European Computers Manufactures
27	-	Association's (ECMA) key is a way to
28		allow any publisher to develop compliant .NET core libraries that can be authenticated by other applications.

2	·	.NET Security Framework - pg 124 "Strong naming is a process whereby an
		assembly name can be further qualified by
• 3		the identity of the publisher."
		NET Security Framework – pg 133
4		The publisher must advertise its public key
_		or keys in an out-of-band fashion (such as
5	• •	documentation shipped with the product or
,		on the company Web site)
6		.NET Security Framework - pg 130
7		The goal of the ECMA key is to allow a
,		slightly more generalized strong name
8		binding than usual, namely allowing
•	r ·	binding to the publisher of the runtime in
9		use, rather than to a fixed publisher.
	incorporating said item into a secure digital	Signing the assembly places it in a secure container.
10	container;	NET Framework Security – pg 527
		Strong named assemblies cannot be
11		modified in any manner without destroying
10		the strong name signature.
12		Applied Microsoft NET Framework
13		Programming – pg 89
15	·	Strongly Named Assemblies Are Tamper-
14		Resistant
		When the assembly is installed into the
15		GAC, the system hashes the contents of the file containing the manifest and compares
		the hash value with the RSA digital
16		signature value embedded within the PE
17		file (after unsigning it with the public key).
17		If the values are identical, the file's
18		contents haven't been tampered with and
10		you know that you have the public key that
19		corresponds to the publisher's private key.
		In addition, the system hashes the contents
20		of the assembly's other files and compares the hash values with the hash values stored
		in the manifest file's FileDef table. If any
21	·	of the hash values don't match, at least one
22	·	of the assembly's files has been tampered
22		with and the assembly will fail to install
23		into the GAC.
22	associating a first rule with said secure	A NET assembly includes imperative and

INTERTRUST INFRINGEMENT CHART FOR U.S. PATENT NO. 5,915,019

3	FOR U.S. PATENT NO. 5,915,019	
5 5 6	85 (second alternate scenario for .NET)	Infringing products include the .NET Framework SDK, Microsoft Visual Studio .NET, the Microsoft Installer SDK, and products that include the Microsoft .NET CLR, and the Microsoft Installer technology.
	A method comprising the following steps:	
7	a first rule set and first protected	The first protected information is a .NET component.
,		The first alternative for the first secure
9		container is the signed and licensed .NET
10		component. The first rule set is the set of declarative statements comprising the LicenseProviderAttribute in the .NET
11		component.
12		The second alternative for the first secure container is a (signed or unsigned) .NET
13		within a cabinet file signed by the NET
14	·	assembly developer. The first rule set is the set of declarative statements comprising
15		the LicenseProviderAttribute in the .NET component.
16		The third alternative for the first secure
17		container is a .NET component whose hash
18		is included in the assembly header of a .NET assembly. The first rule set is the set
19		of declarative statements comprising the LicenseProviderAttribute in the .NET
20		component.
20	storing said first secure container in a first	The first secure container is stored at the
21	memory;	.NET assembly developer's location.
22	creating a second secure container comprising a second rule set;	The second secure container is the signed .msi file in which the .NET assembly
23		developer packages its signed assembly.  The second rule set is the conditional
24		syntax statement(s) written by the .NET assembly developer and placed into the
		signed .msi file.
25	storing said second secure container in a second memory;	The second secure container is stored at the
26	copying or transferring at least a first	.NET assembly developer's location.
	portion of said first protected information	The .NET assembly developer places the .NET component into the third secure
27	to said second secure container, said	container, which is the signed .NET
28	copying or transferring step comprising:	assembly.
20	creating a third secure container comprising a third rule set;	The third secure container is a signed .NET
	"	assembly and the third rule set is

•	II.	
1		declarative statement(s) within the assembly's header.
2	copying said first portion of said	Copying the .NET component to the .NET
. 3	first protected information; transferring said copied first portion	Transferring the .NET component to the
4	of said first protected information to said third secure container; and	.NET assembly.
5	copying or transferring said copied first portion of said first protected	When the second secure container is the signed .msi file and the third secure
6	information from said third secure container to said second secure	container is the signed .NET assembly, the .NET assembly is placed into the signed
7	container.	.msi file.
8	87. A method as in claim 85 in which said copied first portion of said first protected	The entire .NET component is copied.
- 9	information consists of the entirety of said first protected information.	
10		
11	90. A method as in claim 85 in which said first memory and said second memory	First and second memory is at the .NET
12	are located at the same site.	assembly developer's location.
13	93. A method as in claim 85 in which	
14	said step of copying transferring said copied first portion of said first protected	When the third secure container is the signed .NET assembly, it is placed in the
15	information from said third secure container to said second secure container	signed .msi file.
	C. al	
16	further comprises storing said third secure container in said second secure container.

#### INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP. INTERTRUST INFRINGEMENT CHART FOR U.S. PATENT NO. 5,949,876

_		
4.		
5	2.	Infringement is based on Microsoft's Visual Studio .NET and/or the .NET Framework licensing tools (in
6		the.NET Framework SDK) and/or Microsoft Installer SDK
7	A system for supporting electronic commerce including:	
8 .	means for creating a first secure control set at a first location;	The first location is a .NET component developer's site.
9 .		The first secure control set is the set of declarative statements comprising the <i>LicenseProviderAttribute</i> of
10		a first .NET licensed component that provides for a design-time license to use the control. This attribute
11		also specifies the type of license validation that occurs. The component is encapsulated in a signed .NET assembly.
12	means for creating a second secure	The second location is the .NET application developer's site where a .NET application comprising
13	control set at a second location;	one or more assemblies is created.
14		The second secure control set comprises the declarative statement(s) (including licensing
15		statements, and code access security statements) of a signed .NET assembly using or calling the first .NET
16 17		component. The control set can include a set of security permissions demanded by the .NET assembly
18		containing the licensed component, whereby the permissions are demanded of components that call the
19		application components. The control set can also be extended by controls expressed as conditional syntax
20		statements in a signed .msi file containing a click through end-user license (the end-user license scenario).
21	means for securely communicating said first secure control set from said first	The first .NET control set is securely communicated from the first location developer to the .NET solution
22	location to said second location; and	provider by either being contained in a signed assembly, within a signed cabinet file or within a
23	means at said second location for	signed .msi file.  At the second location, the solution developer uses the
24	securely integrating said first and second control sets to produce at least a	.NET runtime that includes the LicenseManager.
25	third control set comprising plural elements together comprising an	Whenever a class (control or component) is instantiated (here, an instance of the first .NET
26	electronic value chain extended agreement.	licensed component), the license manager accesses the proper validation mechanism for the control or
27		component. A value chain is created through the creation of a run-time license for use of the first .NET
28		component in the context of use of the .NET application developed at the second location. The
		11

Exhibit É

293482.02

1

2

1 2 3		license controls for the runtime license (derived from the design time license) are bound into the header of the .NET application assembly, along with the second control set.
		The creation of runtime license controls is securely
. • 4		handled by Visual Studio.NET or the LC tool. Runtime licenses are embedded into (and bound to)
5		the executing assembly. The license control attribute included in the first .NET component is customized in
6		the second location to express and require the runtime license. In a different scenario, the LC tool is used to
7	, v	create a ".licenses file" containing licenses for multiple components, including runtime licenses for
8		components and classes created by the license
9		provider. This .licenses file is embedded into the assembly.
10	4	The third control set is an extended value chain agreement that comprises the runtime license controls
11		for the first .NET licensed class (that had been bound to the assembly), the declarative controls provided by
12		the solution provider in the solution provider's assembly, and any runtime licenses for other
13		components included by the solution provider in the solution provider's assembly, and any end user license
14		agreement provided by the application provider. The controls are typically integrated into the header of the
15		.NET application assembly calling the first .NET licensed component.
16		A further "end user licensing scenario" occurs when,
17		at the second location, the application developer packages the application into a signed .msi file that
18		includes conditional syntax statement controls that require that a user read and agree to an end user
19		license agreement for the application and the embedded first component. The third control set
20		includes a plurality of elements that include the run- time licenses mentioned above, security permissions
21		controls, EULA controls (a fourth control set), all securely bound into the signed .msi file.
22	·	securely bound into the signed linsi inc.

### INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP. INTERTRUST INFRINGEMENT CHART FOR U.S. PATENT NO. 6,389,402

4	LANGUAGE TELESCOPE	CLAIM OF INFRINGEMENT
5	1.	Products infringing: Microsoft Visual Studio .NET, .NET License Compiler, .NET
6		Framework SDK, and .NET Common Language Runtime
7	A method including	A method for producing a third .NET component (application) that incorporates first
8		and second .NET component whose distribution is license controlled.
9	creating a first secure container including a	The first secure container is a first signed
10 11	first governed item and having associated a first control;	NET component that includes a license control. The governed item is the .NET component.
12		The first control is the set of declarative statements comprising the
13		LicenseProviderAttribute of a first .NET licensed component that provides for a design-
14		time license to use the control. This attribute also specifies the type of license validation that
15		occurs.
16 17	creating a second secure container including a second governed item and having associated a second control;	The second secure container is the second signed .NET component that includes a license control. The governed item is the .NET component.
18		The second control is the set of declarative
19		statements comprising the LicenseProviderAttribute of a second .NET
20 21		licensed component that provides for a design- time license to use the control. This attribute also specifies the type of license validation that
22		occurs.
23	transferring the first secure container from a first location to a second location;	The creator distributes a signed and licensed .NET component.
24		An application developer at a second location
25		downloads a first .NET component for inclusion into an application.
26	transferring the second secure container from a third location to the second location;	A creator distributes a signed and licensed .NET component from a different location.
27 28		Application developer downloads a second .NET component for inclusion into an
	\$	application.

2	at the second location, obtaining access to at least a portion of the first governed item, the access being governed at least in part by the	At the second location, the application developer uses the .NET runtime that includes the LicenseManager to access a first governed
4	first control;	item.
5		Whenever a class (control or component) is instantiated (here, an instance of the first .NET licensed component), the license manager accesses the proper validation mechanism for
7	•	the control or component.
8		The first control comprises the declarative statement(s) (including licensing statements, and code access security statements) of the first .NET component.
10 11 12 13 14 15 16 17	at the second location, obtaining access to at least a portion of the second governed item, the access being governed at least in part by the second control;  at the second location, creating a third secure container including at least a portion of the first governed item and at least a portion of the second governed item and having associated at	At the second location, the application developer uses the .NET runtime that includes the LicenseManager to access a second governed item.  Whenever a class (control or component) is instantiated (here, an instance of the second .NET licensed component), the license manager accesses the proper validation mechanism for the control or component.  The second control comprises the declarative statement(s) (including licensing statements, and code access security statements) of the second .NET component.  At the second location, the application developer uses the .NET runtime that includes the LicenseManager to access a first governed item and second governed item to construct an
19 20	least one control, the creation being governed at least in part by the first control and the second control.	application, the third secure container.  Creation governance is accomplished by invoking the .NET runtime to access the first governed item and the second governed item.
21 22		Whenever a class (control or component) is instantiated the license manager accesses the proper validation mechanism for the control or
23		component.
<ul><li>24</li><li>25</li><li>26</li></ul>		The portions of the first governed item and second governed item that are being included in the third secure container will typically include the governed items themselves, ie. the .NET components.
27 28		The associated control in this case is the LicenseProviderAttribute, created and inserted into the application.

**EXHIBIT C** CONFIDENTIAL—SUBJECT TO PROTECTIVE ORDER OF NOVEMBER 19, 2001: Exhibit C contains documents or things that are the subject of a Protective Order of this Court and cannot be opened or its contents made available to anyone other than this Court or counsel of record for the parties.
